                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                retroelement containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see AAZ55254-61). Also provided are plant retroviral particles that are used to transfer the nucleic acids into plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         provides molecular tools in the form of retroelements and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence comprises a consensus of reverse transcriptase gene sequences identified in revirus-like element (retroelement) calyps of soybean (see AAZ35280), cyclops of pea (see AAZ35266) and athila of Arabidopsis thailana (see AAZ35264). The invention

                                                                                      retroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least I agronomically-significant characteristic (ACS). In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see AAZ35254-61). Also provided are plant retroviral particles that are used to transfer the nucleic acids
                                                                                                                                                                                                                                               The present sequence comprises a generic plant retroelement obtained from retrovirus like elements (retroelements) calypso of soybean, cyclops of pea and athila of Arabidopsis thaliana. The invention provides molecular tools in the form of retroelements and

                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cretroelements were identified, i.e. Calypso 1-1, 1-2 and 1-3 (see AAZ35271-73) and Calypso 2-1 and 2-2 (see AAZ35274-75). The retroelements include gag, pol, env and primer binding site sequences that can be used in constructs of the invention. The invention provides molecular tools in the form of retroelements and retroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see AAZ35254-61). Also provided are plant retroviral particles that particles are used to transfer the nucleic acids into plant cells.

Soybean retroelement calypso reverse transcriptase gene

```
The present sequence represents the reverse transcriptase gene of cretrovirus-like element (retroelement) calypso of soybean. The cinvention provides molecular tools in the form of retroelements and retroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse H sequence (see AAZ35254-61). Also provided are plant retroviral particles that comprise a retrovirus protein encoded by a nucleic acid sequence encoding a plant retroviral envelope protein and a nucleic acid including e.g. the present sequence. These plant retroviral particles that compared to transfer the nucleic acid into plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
This is the nucleotide sequence of the Calypso 1-1 retroelement of soybean. It was identified by screening of a soybean lambda ilbrary using a reverse transcriptase probe. 2 Groups of soybean retroelements were identified, i.e. Calypso 1-1, 1-2 and 1-3 (see AAZ35271-73) and Calypso 2-1 and 2-2 (see AAZ35274-75). The retroelements include gag, pol, env and primer binding site retroelements include gag, pol, env and primer binding site invention provides molecular tools in the form of retroelements and retroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAZ35271 standard; DNA; 9829

(see AAZ35254-61). Also provided are plant retroviral particles that particles are used to transfer the nucleic acids into plant cells.

```
retroelement containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see AR35524-61). Also provided are plant retroviral particles that
                                                                                                                                                                                                                                                                          soybean. It was identified by screening of a soybean lambda library using a reverse transcriptuse probe. 2 Groups of soybea retroelements were identified, i.e. Calypso 1-1, 1-2 and 1-3 (see AAZ35271-73) and Calypso 2-1 and 2-2 (see AAZ35274-75). The retroelements include gag, pol, env and primer binding site sequences that can be used in constructs of the invention. The invention provides molecular tools in the form of retroelements invention provides molecular tools in the form of retroelements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

                                                                                                         which expresses gag, pol and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see ARZ35254-61). Also provided are plant retroviral particles that
                                                                                                                                                                                                                      retroelement containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement carries at least 1 agronomically-significant characteristic (ACS). In a preferred method, a helper cell line than the retroelement carries at least 1 agronomically-significant
                                                                                                                                                                                                                                                                                   soybean. It was identified by screening of a soybean lambda library using a reverse transcriptase probe. 2 Groups of soybean retroelements were identified, i.e. Calypso 1-1, 1-2 and 1-3 (see AAZ35271-73) and Calypso 2-1 and 2-2 (see AAZ35274-75). The retroelements include gag, pol, env and primer binding site sequences that can be used in constructs of the invention. The invention provides molecular tools in the form of retroelements are invention provides molecular tools in the form of retroelements are

Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, reverse transcriptase, protease or RNAse-H sequence (see AAZ35254-61). Also provided are plant retroviral particles that comprise a retrovirus protein encoded by a nucleic acid sequence encoding a plant retroviral envelope protein and a nucleic acid including e.g. the present sequence. These plant retroviral particles are used to transfer the nucleic acids into plant cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a recombinant DNA construct of a (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors the construction of transgenic plant and animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant DNA construct comprising a plant centromere, useful producing stably inherited michrosomes which can serve as vector the construction of transgenic plant and animal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-MAR-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BAC containing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        allow for replication and integration. Claimed isolated nucleic acid molecules comprise a nucleic acid sequence selected from a retroelement primer binding site, envelope, gag, integrase, rever transcriptase, protease or RNAse-H sequence (see AA2535254-61). A provided are plant retroviral particles that comprise a retroviru retroviral encoded by a nucleic acid sequence encoding a plant retroviral envelope protein and a nucleic acid including e.g. the present sequence. These plant retroviral particles are used to transfer the nucleic acids into plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and env sequences is used to enable transfer of a secondary construct which carries an ASC and has retroelement sequences that allow for replication and intermetical contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tools in the form of retroelements and retroelement-containing vectors, cells and plants. Methods are provided for introducing the retroelements into cells, especially when the retroelement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      carries at least 1 agronomically-significant characteristic (ACS) In a preferred method, a helper cell line which expresses gag, po
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 retrovirus-like element (retroelement) athila of soybean. Athila was identified in a BLAST search of DNA sequences generated by the sequence of the sequence of the relation of the sequence of the sequence of Ty3/gypsy retrotransposons. The invention provides molecular

                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a recombinant DNA construct of a pla (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant and animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors, cytokines, antibodies, and growth factors.

                                                                                                                                                               The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant and animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors, cytokines, antibodies, and growth factors.

The present invention relates to a (Arabidopsis thaliana) centromere.
                                                     Recombinant DNA construct comprising a plant centromere, useful for producing stably inherited michrosomes which can serve as vectors fithe construction of transgenic plant and animal cells
